Structures placed on hillsides often present a number of challenges and a limited number of economical choices for site design. An option sometimes employed is to use the building frame as a retaining element, comprising a Rigidly Framed Earth Retaining Structure (RFERS). The relationship between temperature and earth pressure acting on RFERS, is explored in this monograph through a 4.5 year monitoring program of a heavily instrumented in service structure.

Rigidly Framed Earth Retaining Structures - springer
Structures placed on hillsides often employ the building frame to retain earth on one side only and derive their resistance to lateral earth pressure from rigid frame action, without the presence of any other restraining elements or forces against lateral displacement.
